

Gamified ETFs on Robinhood Chain.

Build an ETF from real stocks, lock it for the week, and beat the median to get paid on Friday.

THE PROBLEM

Stocks went on-chain. Then they sat still.

01

Idle assets

Over 90% of tokenized stock value is used nowhere on-chain. You can hold it, sell it, or borrow against it.

02

Unpaid knowledge

People who read markets well earn from followers, not from being right. A quiet expert with a great record earns nothing.

03

Unprovable records

Portfolios get posted, never locked. Without a locked, priced record, skill and luck look exactly the same.

WHAT IDLE COSTS

About \$2.9B in stocks on-chain, mostly doing nothing.

In DeFi · \$247.8M

Sitting in wallets · about \$2.65B

Tokenized stocks that can move between wallets, about \$2.9B

8.5%

of tokenized stock value is deposited in DeFi at all: \$247.8M

~2%

is lent out. Lending is about a quarter of that DeFi use; the rest is pools

56%

of tokenized assets over \$100k made zero on-chain transfers in a week

Sources: Token Terminal via BelnCrypto (tokenized stocks in DeFi, Sept 2026); rwa.xyz (distributed value of tokenized stocks, mid-Sept 2026); Binance Research via BelnCrypto (DeFi use mix); BelnCrypto Research and rwa.xyz (weekly transfers, 2026)

WHY NOW

Stocks just became programmable.

90+

Stock Tokens on Robinhood Chain mainnet, live since July 2026

3×

growth in tokenized stocks on-chain this year, to \$3B

\$1.23T

record net inflows into US ETFs, January to July 2026

20–25%

of US stock trading volume comes from retail investors

TOKENIZED STOCKS ON-CHAIN

Sources: The Block and CertiK (Robinhood Chain mainnet, July 2026); rwa.xyz (tokenized stocks); ETFGI via Advisor Perspectives (US ETF flows, Jan to Jul 2026); JPMorgan via Benzinga (retail share of US equity volume)

THE SOLUTION

Build an ETF. Lock it. Beat the median.

A new job for tokenized stocks: compete. Every ETF is a real basket, scored on real prices, every week.

01

Build

Pick 3 to 10 Robinhood Stock Tokens and set the weights. BTC and ETH can make up to 20%.

02

Lock

Lock the basket with a \$5 ticket. It becomes a public ETF that others can back or buy.

03

Beat the median

On Friday, ETFs above MEDIAN split the tickets below it. Your stocks come back either way.

A NEW APPROACH

Stocks that compete.

	TODAY	WITH PROFIT MARKETS
A Stock Token	Held, sold or borrowed against	Competes every week, and still earns its price moves and dividends
Stock knowledge	Paid through followers	Paid for accuracy: winnings, a share of backers' wins, buy fees
A track record	Screenshots and claims	Locked, priced and public on-chain
An ETF	An issuer, lawyers and months	Anyone, one week, \$5
A trading agent	Trades alone, unmeasured	Ranked against people every week

HOW A ROUND WORKS

One week, start to payout.

WHERE A LOSING TICKET GOES

90% to ETFs above MEDIAN, split by stake × accuracy, plus all ticket interest

Creators take 10% of their backers' winnings.

5% platform · 5% season pot

SCORING

Half the field wins. The better half.

A rising market doesn't pay everyone. You win by beating the crowd, which makes it a game of skill.

Below MEDIAN: the ticket goes to the pot

Above: a share of the pot, more for a bigger lead

An illustrative round of seven ETFs. On MEDIAN is a draw: the ticket comes back.

Live today on testnet.

Build an ETF

37 assets: Robinhood Stock Tokens plus BTC and ETH. Name it and set a buy fee.

Back an ETF

Put a \$5 ticket on someone else's ETF and share in its winnings.

ETF pages

Live return against MEDIAN and the S&P 500, the field, and what's inside.

Tickets that earn

Tickets wait in a USDG savings vault. The interest goes into the pot.

Runs itself

A keeper locks, scores, settles and opens the next round every week.

For agents

An MCP server, so any AI agent can read the league and prepare moves.

BUILT TO BE TRUSTED

Peer to peer.
Checkable by anyone.

- ✓ The platform never takes the other side of a ticket
- ✓ Locked stocks go back to their owner, win or lose
- ✓ Prices from Robinhood Chain's Chainlink feeds, dividends included
- ✓ Every settlement input is published, with its hash on-chain
- ✓ The contract checks the pot adds up and caps every payout
- ✓ Three days after a round, anyone can void it and get their stake back

Agents get the whole league, through one connection.

Any MCP client connects to `/api/mcp`. Agents read live data and prepare moves; the user's wallet signs every one.

READ · LIVE DATA

<code>get_rules</code>	Contracts, ticket size, basket limits, how winners are decided
<code>list_stocks</code>	Every Stock Token with its live price and move this round
<code>get_round</code>	Standings, MEDIAN, and what a \$5 ticket pays right now
<code>get_my_entries</code>	A wallet's entries, status and what it can claim

ACT · THE WALLET SIGNS

<code>plan_create_etf</code>	Build and lock an ETF with a \$5 ticket
<code>plan_back_team</code>	Back any ETF in the round
<code>plan_buy_basket</code>	Buy the stocks through 0x, split by weight
<code>plan_buy_etf</code>	Buy a creator's ETF; the creator earns the fee
<code>plan_claim</code>	Collect winnings and the locked basket

Claude skill

No keys held

Every round brings new demand and volume to Stock Tokens.

Demand

Every ETF starts with buying 3 to 10 Stock Tokens to lock.

Long-tail volume

One ETF buy becomes trades in every stock in the basket, not just the top names.

Weekly turnover

A new round every week is a reason to re-weight every week.

Agent flow

Agents trade on a schedule, adding steady, programmatic volume.

We don't make markets; we bring buyers and order flow, which draws liquidity. Buy flows switch on at mainnet.

People already buy baskets and back views.

TAM · \$15.78T

Held in US ETFs, a record. The habit of owning a basket.

SAM · \$63.5B a year

Traded on prediction markets in 2025. The habit of backing a view with money.

SOM · \$26M a year

In tickets: 100,000 a week, three years after mainnet.

We earn on volume, never on the market.

5%

Of losing tickets. Taken at settlement, live in the contract today.

Fee

On Buy the ETF. A platform fee on basket buys through 0x, next to the creator's. At mainnet.

Pro

Private leagues. Communities and brands run their own rounds. On the roadmap.

100,000 tickets a week → \$225k below MEDIAN → \$11,250 a week at 5% → ≈ \$585k a year, before buy fees

Illustrative model, not a forecast. Testnet is free and nothing is charged.

Built, tested and live on testnet.

44

contract tests, including a mainnet fork with real Stock Tokens

73

app tests on settlement, scoring, prices and agents

37

assets to build with: Stock Tokens, BTC and ETH

9

agent tools on the MCP server

Escrow contract on testnet

Weekly keeper running

Live P&L vs MEDIAN and S&P 500

Ticket savings vault

Buy the ETF via 0x, built

Open-source settlement engine

Every week adds to a dataset nobody else has.

Verified track records

Every creator and agent, week by week, locked and priced. Impossible to fake.

Crowd signal

What thousands of people choose to hold, and at what weights, before the week moves.

Agent benchmark

A recurring, public test for trading agents, with real stakes.

Index products

The best creators' baskets, offered as indexes people can follow.

Long-term value that grows with volume. Round history is already open through the API.

Where Profit Markets fits

WHO	WHAT THEY DO	WHAT'S MISSING
Brokerage apps	Buy and sell single stocks and ETFs	No scoreboard, no way to publish a basket
Polymarket, Kalshi	Back the outcome of an event	You back events, not portfolios you built
Copy trading	Copy another trader's portfolio	Custodial, no weekly head to head
Thematic ETFs	Baskets built by fund issuers	Top down, months to launch
Profit Markets	Anyone builds an ETF, and it competes every week	On-chain, peer to peer, creators earn

Three ways in

Kickoff's players

Kickoff already runs weekly markets on Robinhood Chain. Same wallet, same weekly habit, a second game.

ETF creators

Creators earn on every buy and on their backers' wins, so each one brings an audience.

Agent builders

A public weekly benchmark for trading agents, reached through MCP and the tools they already use.

From testnet to mainnet

NOW

Live on testnet

Weekly rounds, ETF pages with live P&L, tickets in a savings vault, agents over MCP.

NEXT

Mainnet with caps

External audit, Robinhood Earn for tickets, Buy the ETF through 0x, a launch with ticket caps.

THEN

Seasons and leagues

Season prizes, private leagues, agent rounds, a crowd index and data products, more assets as Robinhood lists them.

Gamified ETFs, owned by the people who build them.

What takes us to mainnet: an external audit, Robinhood Earn for tickets, Buy the ETF through 0x, and a launch with caps.
